- The invention relates to a decorative shade for a video display, and particularly to a decorative shade for a video display, which has artistic features to decorate the video display.
- 7 2. Description of Related Art
 - Video displays are common in households and include computer monitors, televisions and video game monitors. However, the appearance of a computer monitor or a television not in use is a monotonous frame and a dark, blank screen. Therefore, the video display does not have any decorative features when the video display is not used. With video display trends tending toward thin, very large video displays, large-size plasma televisions and liquid crystal displays (LCD) over 40-inches in size have been created and are becoming common. As such, video displays are becoming a larger visual proportion for interior decoration, and the monotonous appearance of video displays is a drawback that most consumers have no choice but to accept.
 - Additionally, the plasma televisions and the liquid crystal displays are often suspended at high places so they are not easily cleaned.
- Furthermore, screens on liquid crystal displays are soft and easily damaged.
- Therefore, a protective, dust-proof device must be used with large-size or
- 23 pliable video displays such as plasma televisions or liquid crystal displays,
- 24 respectively.

The present invention has arisen to provide a decorative shade for a 1 video display to provide dust-proof protection and artistic features at the 2 same time. 3 SUMMARY OF THE INVENTION 4 A first objective of the present invention is to provide a decorative 5 shade for a video display, which has artistic features to decorate the video 6 7 display. A second objective of the present invention is to provide a decorative 8 shade for a video display that provides dust-proof protection for the video 9 display. 10 Further benefits and advantages of the present invention will become 11 apparent after a careful reading of the detailed description in accordance with 12 the drawings. 13 **BRIEF DESCRIPTION OF THE DRAWINGS** 14 Fig. 1 is an exploded perspective view of a first embodiment of a 15 decorative shade for a video display in accordance with the present invention; 16 Fig. 2 is a side plan view in partial section of the decorative shade in 17 Fig. 1 mounted on a video display; 18 Fig. 3 is an operational perspective view of the decorative shade in 19 Fig. 1 mounted on a liquid crystal display; 20 Fig. 4 is an exploded perspective view of a second embodiment of 21 the decorative shade in accordance with the present invention with a blind 22 that moves transversally; 23

- 4 decorative shade formed on a liquid crystal display;
- Fig. 7 is an operational perspective view of the third embodiment of
- 6 the decorative shade with the blind retracted; and
- Fig. 8 is a perspective view of a living room with a video display that
- 8 has a decorative shade.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

- A decorative shade for a video display with a screen comprises a
- window with an opening to mount to the video display, a rolling device
- mounted inside the window, and a blind mounted on the roller. The window
- is either detachably mounted on the video display or integrally formed on the
- 14 video display.

9

- With reference to Figs. 1 and 2, a first embodiment of the decorative
- shade in accordance with the present invention comprises a window (10), a
- 17 rolling device (20), and a blind (30).
- The window (10) is a rectangular frame and has a front face (not
- numbered), a rear face (not numbered), a rectangular opening (12) and a
- flange (14). The front face of the window (10) has specific patterns or
- embossments to make the window (10) look like a frame for a painting. The
- 22 front and rear faces have a common outer edge, and the flange (14) is formed
- 23 around and extending from the outer edge of the rear face and has a top inner
- face (not numbered), a bottom inner face (not numbered), two inner side-

- faces (not numbered), two roller brackets (16) and two optional rails (18).
- When the window (10) is mounted on the video display (40), the opening (12)
- aligns with the screen (42). The top inner face has two ends (not numbered).
- The roller brackets (16) are mounted respectively at opposite ends of the top
- 5 inner face. Each end bracket (16) has a hole that aligns with the hole in the
- other roller bracket (16). The rails (18) are mounted respectively on the two
- 7 inner side-faces and guide the blind (30) when the blind (30) moves.
- The rolling device (20) comprises a roller (22) and a driver (24). The
- 9 roller (22) has two ends respectively penetrating the holes in the roller
- brackets (16). Thereby, the roller (22) is suspended at the top inner face of
- the window (10). The driver (24) is attached to one end to rotate the roller
- (22). The driver (24) may be either electrically or manually driven.
- 13 Preferably, the driver (24) is electrically driven by a remote control.
- The blind (30) wound on the roller (22) has an attached end (not
- numbered), a free end (not numbered), two side edges (not numbered), a
- weighted rod (32) and an outer surface (not numbered). The attached end is
- attached to the roller (22), and the free end is wound on or off the roller (22)
- to uncover or cover the opening (12) of the window (10). Because the roller
- 19 (22) is rotated clockwise or counterclockwise by the driver (24), the blind
- 20 (30) is wound off or onto the roller (22) to selectively cover or uncover the
- screen (42). The weighted rod (32) is attached to the free end and has two
- 22 ends (not numbered). The ends of the weighted rod (32) extend respectively
- beyond the side edges of the blind (30) and are slidably mounted respectively
- in the rails (18). The weighted rod (32) pulls the blind (30) down and keeps

the blind (30) flat. The outer surface of the blind (30) has a picture facing the opening (12) so the window looks like a painting or a decorative picture when the blind (30) covers the screen (42).

With further reference to Fig. 3, the decorative shade is attached to a video display (40) by pressing the rectangular flange (14) around the video display (40). When the video display (40) needs to be used, the blind (30) is wound up by the rolling device (20) to reveal the screen (42). When the video display (40) is not being used, the blind (30) is unwound to cover and protect the screen (42). The blind (30) also keeps the video display (40) free from dust. The patterns on the front face of the blind (30) transform the decorative shade to a framed piece of artwork. Thereby, the decorative shade changes a simple covered video display (40) to a decorative picture.

With reference to Fig. 4, a second embodiment of the decorative shade in accordance with the present invention has a blind (30) that moves transversally inside the window (10). The rolling device (20) is mounted in one inner side-face of the flange (14). Since gravity will not pull the blind (30) over the video display, a closing device (35) is mounted the inner side-face of the flange (14) opposite to the rolling device (20). The closing device (35) has the same elements as the rolling device (20) including a roller (not numbered) and a driver (not numbered) plus two cords (352). The roller (22) has two ends (not numbered). The cords (352) are attached between the roller and the weighted rod (32) (or the blind cloth) respectively at the two ends to keep the blind (30) straight and flat. Preferably, the closing device (35) and the rolling device (20) are operated synchronously in the same rotating

- direction to extend or retract the blind (30).
- With reference to Figs. 5 to 7, a third embodiment of the decorative
- 3 shade in accordance with the present invention has a flange (14') of the
- 4 window (10') formed integrally with the video display. Other elements in the
- 5 third embodiment are the same as those in the first and the second
- 6 embodiments. Therefore, further description would be redundant and is not
- 7 included.
- With reference to Fig. 8, the window (10") of the decorative shade
- 9 attached to a large-size plasma television not only protects and keeps dust off
- the plasma television but also changes the plasma television to a decorative
- 11 picture.
- Although the invention has been explained in relation to its preferred
- embodiment, many other possible modifications and variations can be made
- without departing from the spirit and scope of the invention as hereinafter
- 15 claimed.
